In Chapter 3 we described the options to build a time series database with a wide table design based on loading data point by point or by pulling data from the table and using a background blob maker to compress data and reload blobs to the storage tier, resulting in hybrid style tables (wide row + blob). These two options are what basic Open TSDB provides.

But with new types of data come new responsibilities. Time series data is evanescent and voluminous, which is to say, it comes and goes quickly and in great number. That calls for different considerations for storage and retrieval than other types of data. If you want to retrieve a user from a table in a relational database, you can query by any number of attributes in your schema: ID, last name, first name, favorite member of Earth, Wind, & Fire.

Why Should I Use a Time Series Database? - The New Stack

A time series database (TSDB) is a database optimized for time-stamped or time series data. Time series data are simply measurements or events that are tracked, monitored, downsampled, and aggregated over time. This could be server metrics, application performance monitoring, network data, sensor data, events, clicks, trades in a market, and many other types of analytics data.
